Main Concept: Text

a first network interface circuit structured to interpret a first Ethernet data set and to transmit a second Ethernet data

set; a second network interface circuit structured to transmit a first controller area network (CAN) data set and to interpret a second CAN data set; a translation circuit structured to: determine a first message value from the first Ethernet data set and to encapsulate the first message value in the first CAN data set; and determine a second message value from the second CAN data set and to encapsulate the second message value in the second Ethernet data set; and a configuration circuit structured to modify at least one of the first network interface circuit, the translation circuit, or the second network interface circuit in response to a configuration command value; wherein: the first network interface circuit, the translation circuit, the second network interface circuit, and the configuration circuit are defined by an Ethernet switch and/or a CAN gateway each structured to be incorporated into a mobile system; and the configuration circuit is further structured to selectively configure one or more portions of the first network interface circuit, the translation circuit, and/or the second network interface circuit to be defined by the Ethernet switch and/or the CAN gateway.
