FI/F-TERMS:

KEYWORDS OR OTHER ELEMENTS FEATURING THE INVENTION:
A method for perceiving a road environment, comprising: acquiring an associated-region lane attribute and an information to be detected, wherein the information to be detected is collected by an onboard sensor and represents a target region where a vehicle is traveling, the associated-region lane attribute corresponds to an associated region, and the associated region and the target region meet a predetermined similarity condition; and processing the associated-region lane attribute and the information to be detected by using an onboard perception model to obtain a road perception information of the target region.
