STARTUP PROCEDURE FOR A PASSIVE INFRARED SENSING CIRCUIT

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of U.S. Provisional Patent Application No. 63/194,229, filed on May 28, 2021, the entire disclosure of which is hereby incorporated by reference.

BACKGROUND

[0002] Occupancy and vacancy sensors are often used to detect occupancy and/or vacancy conditions in a space in order to control an electrical load, such as, for example, a lighting load. An occupancy sensor may typically operate to turn on the lighting load when the occupancy sensor detects the presence of a user in the space (*e.g.*, an occupancy condition and/or event) and then to turn off the lighting load when the occupancy sensor detects that the user has left the space (*e.g.*, a vacancy condition and/or event). A vacancy sensor may only operate to turn off the lighting load when the vacancy sensor detects a vacancy condition in the space (*e.g.*, the vacancy sensor may not turn on the lighting load in response to an occupancy condition). Therefore, when using a vacancy sensor, the lighting load must be turned on manually (*e.g.*, in response to a manual actuation of a control actuator). Occupancy and vacancy sensors have often been provided in wall-mounted load control devices that are coupled between an alternating-current (AC) power source and an electrical load for control of the amount of power delivered to the electrical load. Such wall-mounted load control devices may comprise internal detectors, such as, for example, a pyroelectric detector, and a lens for directing energy to the pyroelectric detector for detecting the presence and/or absence of the user in the space.

JP2010-230492A discloses a control circuit for an infrared pyroelectric human sensor. The circuit includes a microcomputer that controls at least one sensitivity adjustment means to dynamically adjust circuit parameters.
