AB Liver cancer, specifically hepatocellular carcinoma (LIHC), ranks as the second most common cause of cancer-related fatalities globally. Moreover, the occurrence rate of LIHC is steadily increasing. A recently identified gene, **SPSB2**, has been implicated in cell signaling, impacting the development and progression of non-small cell lung cancer. Nevertheless, studies on the role of **SPSB2** in the pathogenesis of LIHC are lacking. Using the TCGA, GTEx, and GEO databases, we obtained differentially expressed genes that affect the prognosis of patients with LIHC. We utilized the Kruskal-Wallis test, along with univariate and multivariate COX regression analyses, to det. the correlation between **SPSB2** and patient clin. indicators. Potential biol. functions of **SPSB2** in LIHC were explored by enrichment anal., ssGSEA, and Spearman correlation anal. Finally, LIHC cell lines Huh7 and SMMC-7721 were used to validate the biol. function of **SPSB2**. The results showed LIHC patients with higher **SPSB2** expression had a poorer prognosis, and **SPSB2** expression was significantly correlated with LIHC patients' Histol. grade, Pathol. T stage, Prothrombin time, Pathol. stage, BMI, wt., adjacent hepatic tissue inflammation, AFP level, and OS event ($p < 0.05$). **SPSB2** shows notable enrichment in pathways linked to tumorigenesis and the immune system. Moreover, its expression is strongly connected to immune cells and immune checkpoints. Knockdown of **SPSB2** expression in Huh7 cells and SMMC-7721 cells inhibits **SPSB2**'s biol. functions, including proliferation, invasion, metastasis, and other phenotypes. **SPSB2** plays a crucial role in the development of LIHC. It is related to the immune response and unfavorable outcomes. **SPSB2** may function as a clin. biomarker for prognosis.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB The present disclosure provides 5-aryl-1,2,5-thiadiazolidin-3-one 1,1-dioxide compds. and pharmaceutical compns. comprising the same. The 5-aryl-1,2,5-thiadiazolidin-3-one 1,1-dioxide compds., pharmaceutical compns. thereof, and methods of using the same have a range of utilities as therapeutics, diagnostics, and research tools. The subject compns. and methods are particularly useful for potentiating immune response and/or for treating cancer and other diseases.

AB Background: Renal interstitial fibrosis is a common pathway through which chronic kidney disease progresses to end-stage renal disease. There are currently no effective drugs available to treat kidney fibrosis, so traditional medicine is likely to be a candidate. The therapeutic potential of saikosaponin B2 (SSB2), a biologically active ingredient of Radix Bupleuri, on renal fibrosis has not been reported.Methods: A unilateral ureteral obstruction (UUO) model was conducted to induce renal interstitial fibrosis in mice. SSB2's effect was valuated by histological staining and exploring the changes in expression of relative proteins and mRNAs. A conditional medium containing sonic hedgehog variant protein stimulating normal rat kidney interstitial fibroblast cells (NRK-49F) was used in an in vitro model to determine the possible mechanism. The molecular target of SSB2 was verified using several mutation plasmids.Results: SSB2 administration reduced kidney injury and alleviated interstitial fibrosis by decreasing excessive accumulation of extracellular matrix components in UUO mice. It could also reduce the expression of alpha-SMA, fibronectin and Gli1, a crucial molecule of the hedgehog (Hh) signaling pathway both in vivo and in vitro. In NIH-3T3 cells simulated by conditional medium containing sonic hedgehog variant protein, SSB2 showed the ability to decrease the expression of Gli1 and Ptch1 mRNA. Using a dual-luciferase reporter assay, SSB2 suppressed the Gli-luciferase reporter activity in NIH-3T3 cells, and the IC50 was 0.49 mu M, but had no effect on the TNF-alpha/NF-kappa B and Wnt/beta-catenin signaling pathways, indicating the inhibition selectivity on the Hh signaling pathway. Furthermore, SSB2 failed to inhibit the Hh pathway activity evoked by ectopic expression of Gli2 Delta N and Smo D473H,

suggesting that SSB2 might potentially act on smoothened receptors.Conclusion: SSB2 could attenuate renal fibrosis and decrease fibroblast activation by inhibiting the Hh signaling pathway.

AB The asbestos induced cancer malignant mesothelioma (MM) is difficult to diagnose and has a poor prognosis. MM is an immunol. cancer, therefore autoantibodies may be suitable biomarkers and assocd. with prognosis. We used Protoarray microarrays to det. immune responses to 8798 antigens in 10 MM and 10 asbestos exposed controls and developed diagnostic panels using 17 antigens from this. The AUC of these panels were independently tested in these 10 MM patients and controls and in a validation group of 36 controls and 35 MM patients using luminex assays; none of the antigens identified were validated. Immune responses to RAB38 were assocd. with a better prognosis.

AB The present invention concerns methods and compns. for identifying genes or genetic pathways modulated by miR-16, using miR-16 to modulate a gene or gene pathway, using this profile in assessing the condition of a patient and/or treating the patient with an appropriate miRNA. Thus, a gene expression profile of A549 cells transfected with hsa-miR-16 was detd. This miRNA primarily affected pathways related to cellular growth, development, and proliferation. Since these processes all have integral roles in the development and progression of various cancers manipulation of the expression of genes involved in these pathways represents a potentially useful therapy for cancer.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB The present invention concerns methods and compns. for identifying genes or genetic pathways modulated by miR-16, using miR-16 to modulate a gene or gene pathway, using this profile in assessing the condition of a patient, and/or treating the patient with an appropriate microRNA. Genes and/or physiol. pathways and networks that are influenzed by hsa-miR-16 are identified; the microRNAs govern the activity of proteins that are crit. regulators of cell proliferation and survival, and are assocd. with various cancers and other diseases. Introducing miR-16 (for diseases where the microRNA is down-regulated) or a miR-16 inhibitor (for diseases where the miRNA is up-regulated) into disease cells or tissues would result in a therapeutic response. Prognostic assays featuring any one or combination of miR-16 or the marker genes could be used to assess a patient to det. what if any treatment regimen is justified.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT
AB Described are methods for predicting and diagnosing genetically-based obesity and body fat distribution, and for identifying compds. for the treatment and prevention of obesity. Using microarray and qPCR (real-time RT-PCR) anal., 197 genes were found to be differentially expressed in both adipocytes and stromavascular fraction (SVF)-contg. preadipocytes from s.c. and intra-abdominal depots of the mouse. Of these, Tbx15, Shox2, En1, Sfrp2 and HoxC9 were more highly expressed in cells of s.c. adipose tissue, whereas Nr2f1, Gpc4, Thbd, HoxA5 and HoxC8 were more expressed in intra-abdominal adipose tissue. Further, using qPCR gene expression was investigated in visceral vs. s.c fat of obese and lean human subjects. There were strong correleations of Gpc4, Tbx15 and HoxA5 expression in adipose tissue with BMI (body mass index) and WHR (waist-hip-ratio) in men and women.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB According to the present invention, a kit for diagnosis of cancer, a kit for detg. prognosis of a patient with cancer, a method for assessing a biol. sample, a method for collecting data for detg. whether or not a subject is affected by cancer, and a method for predicting prognosis of a patient with cancer, use a substance that specifically binds to the SPRY domain-contg. SOCS box 2 (SPSB2) protein, a primer set that is capable of amplifying cDNA of the SPSB2 gene, or a probe that specifically hybridizes with mRNA of the SPSB2 gene.

AB Inducible nitric-oxide synthase (iNOS, NOS2) plays a prominent role in macrophage bactericidal and tumoricidal activities. A relatively large amount of NO produced via iNOS, however, also targets the macrophage itself for apoptotic cell death. To uncover the intrinsic mechanisms of iNOS regulation, we have characterized the SPRY domain- and SOCS box-containing protein 1 (SPSB1), SPSB2, and SPSB4 that interact with the N-terminal region of iNOS in a D-I-N-N-N sequence-dependent manner. Fluorescence microscopy revealed that these SPSB proteins can induce the subcellular redistribution of iNOS from dense regions to diffused expression in a SOCS box-dependent manner. In immunoprecipitation studies, both Elongin C and Cullin-5, components of the multi-subunit E3 ubiquitin ligase, were found to bind to iNOS via SPSB1, SPSB2, or SPSB4. Consistently, iNOS was polyubiquitinated and degraded in a proteasome-dependent manner when SPSB1, SPSB2, or SPSB4 was expressed. SPSB1 and SPSB4 had a greater effect on iNOS regulation than SPSB2. The iNOS N-terminal fragment (residues 1-124 of human iNOS) could disrupt iNOS-SPSB interactions and inhibit iNOS degradation. In lipopolysaccharide-treated macrophages, this fragment attenuated iNOS ubiquitination and substantially prolonged iNOS lifetime, resulting in a corresponding increase in NO production and enhanced NO-dependent cell death. These results not only demonstrate the mechanism of SPSB-mediated iNOS degradation and the relative contributions of different SPSB proteins to iNOS regulation, but also show that iNOS levels are sophisticatedly regulated by SPSB proteins in activated macrophages to prevent overproduction of NO that could trigger detrimental effects, such as cytotoxicity.

AB The ubiquitin-proteasome pathway is an important regulatory system for the lifetime of inducible nitricoxide synthase (iNOS), a high-output isoform compared to neuronal NOS (nNOS) and endothelial NOS (eNOS), to prevent overproduction of NO that could trigger detrimental effects such as cytotoxicity. Two E3 ubiquitin ligases, Elongin B/C-Cullin-5-SPRY domain- and SOCS box-containing protein [ECS(SPSB)] and the C-terminus of Hsp70-interacting protein (CHIP), recently have been reported to target iNOS for proteasomal degradation. However, the significance of each E3 ubiquitin ligase for the proteasomal degradation of iNOS remains to be determined. Here, we show that ECS(SPSB) specifically interacted with iNOS, but not nNOS and eNOS, and induced the subcellular redistribution of iNOS from dense regions to diffused expression as well as the ubiquitination and proteasomal degradation of iNOS, whereas CHIP neither interacted with iNOS nor had any effects on the subcellular localization, ubiquitination, and proteasomal degradation of iNOS. These results differ from previous reports. Furthermore, the lifetime of the iNOS(N27A) mutant, a form of iNOS that does not bind to ECS(SPSB), was substantially extended in macrophages. These results demonstrate that ECS(SPSB), but not CHIP, is the master regulator of the iNOS lifetime. (C) 2011 Elsevier Inc. All rights reserved.
