FI/F-TERMS:

KEYWORDS OR OTHER ELEMENTS FEATURING THE INVENTION:
A thermal sensor formed with a cavity covered by a membrane equipped with thermopiles upstream and downstream of a heater. Cold/hot junctions from the thermopiles are all inside an area above the cavity opening when looked from above. The heat is driven out from the cold junction to the substrate by a conducting element. This conducting member may be perforated with holes passing also through the membrane so that the fluid is allowed to be exchanged between outside the cavity and inside the cavity.
